

2. REQUIREMENT ANALYSIS

Project Title

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Introduction

The Requirement Analysis Phase focuses on identifying and defining the requirements needed to develop the proposed IT procurement automation system. In this project,

Requirement Overview

The project requires an automated process for handling standard laptop requests in ServiceNow. The requirement is to create and assign a Catalog Task automatically after the service request is approved, so that the Hardware team can configure the laptop without unnecessary manual intervention.

Requirement Identification

The main requirements identified for the project are to automate the standard laptop ordering and configuration process using ServiceNow Flow Designer. The system should automatically create a Catalog Task after the Standard Laptop request is approved and assign the task to the Hardware group.

- The identified requirements include:
- Automatic creation of a Catalog Task.
- Assignment of the task to the Hardware group.
- Setting the task short description and description.
- Using Service Catalog as the flow trigger.
- Connecting the Flow Designer flow with the Standard Laptop catalog item.
- Allowing users to place a Standard Laptop order through the Service Catalog.
- Verifying the generated Catalog Task after approval.

Requirement Type	Requirement	Description
Functional	Service Catalog Request	User should be able to request a Standard Laptop through the Service Catalog.
Functional	Flow Trigger	The flow should start automatically when a Service

		Catalog request is submitted.
Functional	Catalog Task Creation	A catalog task should be created automatically for the requested laptop.
Functional	Hardware Assignment	The generated task should be assigned to the Hardware team.
Functional	Approval Handling	The request should support the required approval process.
Functional	Request Status	The request and task status should be viewable by the user/IT team.
Non-Functional	Automation	The system should reduce manual work in laptop procurement.
Non-Functional	Efficiency	The system should help process laptop requests efficiently.
Non-Functional	Reliability	The flow should consistently create and assign the required task.
Non-Functional	Usability	The Service Catalog process should be simple and easy to use.

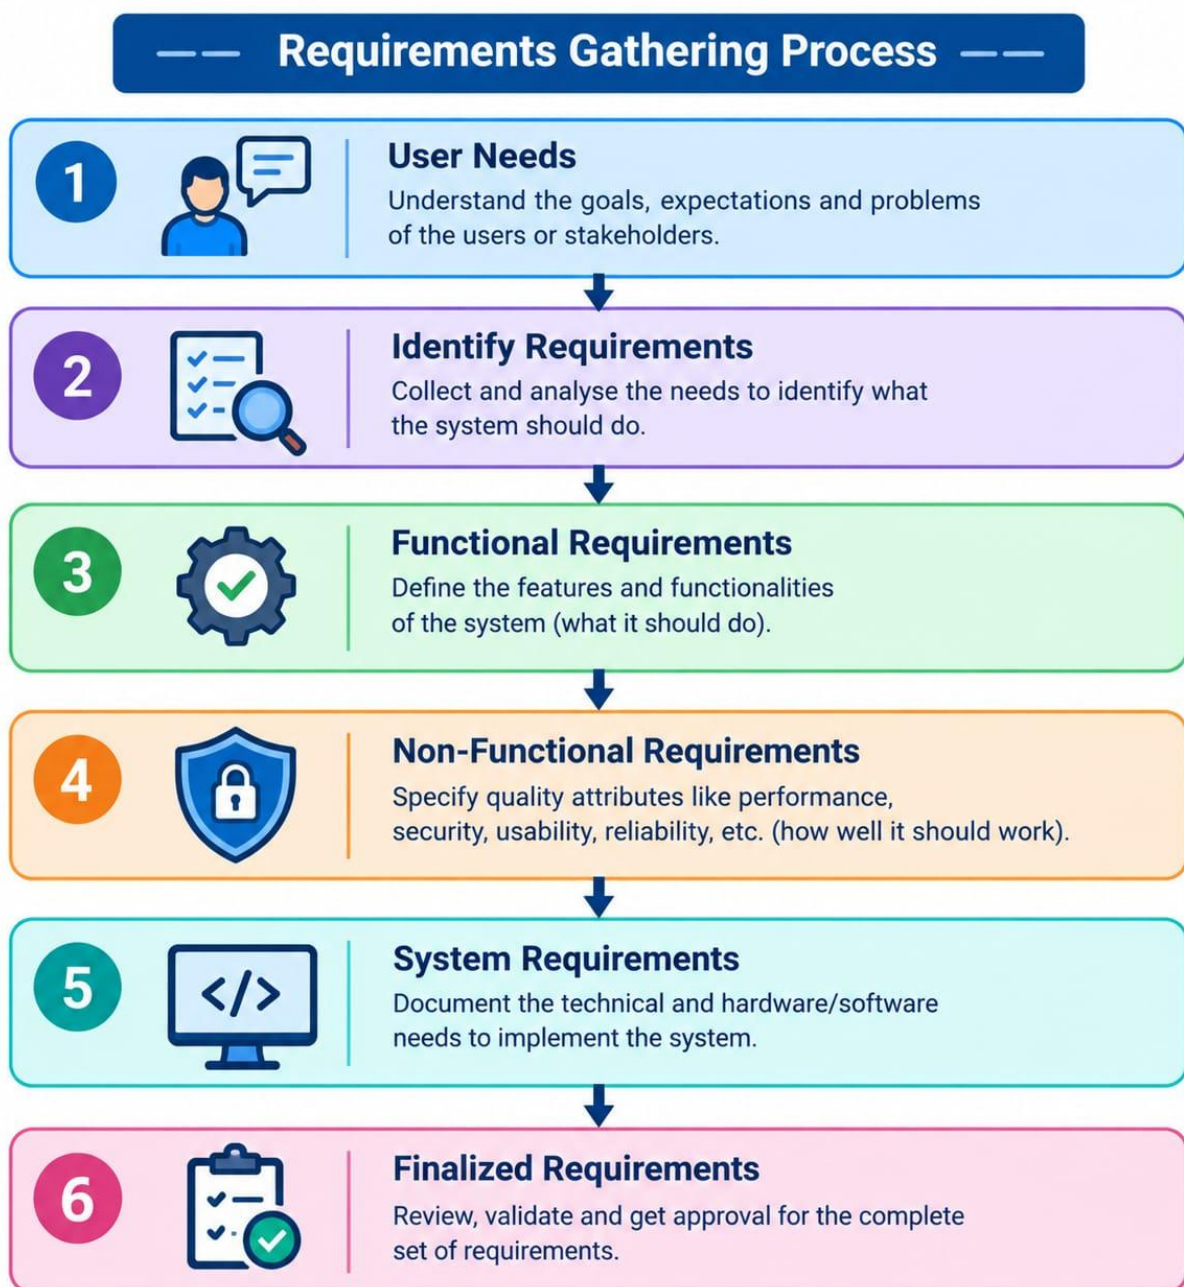

Functional Requirements

Functional Requirement	Description
Flow Designer Workflow	The system shall provide a Flow Designer workflow for handling standard laptop requests.
Service Catalog Trigger	The flow shall be triggered through the Service Catalog process.
Catalog Task Creation	The system shall automatically create a Catalog Task for the requested Standard Laptop.
Short Description	The Catalog Task shall contain the short description "Laptop need to Configured".
Task Description	The description field shall contain "Laptop need to Configured".
Assignment Group	The created task shall be assigned to the Hardware group.
Approval Status	The Approval field shall be set to "Approved".
Flow Assignment	The created flow shall be assigned to the

	Standard Laptop service catalog item.
Laptop Order	The system shall allow the user to place a Standard Laptop order through the Service Catalog.
Task Verification	The generated Catalog Task shall be available for checking after the request is approved

Process Requirements

- Create a Flow named “Standard Laptop Task”.
- Use the Global application and System user for the flow.
- Add a Service Catalog trigger.
- Add the Create Catalog Task action.

- Use the Requested Item Record in the Request Item field.
- Save and activate the flow.
- Open Maintain Items and select the Standard Laptop service catalog item.
- Remove the remaining automations and add the created flow.
- Place the Standard Laptop order from Service Catalog.
- Approve the request and verify the generated Catalog Task.

Expected Requirements Outcome

The requirement analysis establishes that the system must connect the Standard Laptop Service Catalog request with an automated Flow Designer process. Once the request is approved, the system should create a configuration task and assign it to the Hardware group with the required task details.

Source Basis

This Requirement Analysis Phase is prepared from the supplied project document, including its problem statement, user story, project objective, Flow creation steps, flow assignment steps, and Service Catalog process. The source document specifically describes creating a Catalog Task, assigning it to Hardware, and setting the approval to Approved.

Conclusion

The Requirement Analysis Phase defines the essential requirements for automating the standard laptop procurement process. The identified requirements ensure that an approved laptop request can trigger the required catalog task, update the task details, and assign it to the appropriate Hardware group.
