

5. PROJECT DEVELOPMENT PHASE

Project Title

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Introduction

The Project Development Phase is the stage where the planned requirements and design are converted into a working system. In this project, the main objective is to automate the process of ordering standard laptops for employees using Flow Designer.

Development Objectives

The main objectives of the development phase are:

- To develop an automated laptop ordering process.
- To reduce manual work for the IT procurement team.
- To automate approval-related activities.
- To validate standard laptop requests.
- To reduce errors in the procurement process.
- To provide a structured process for handling laptop orders.
- To improve the speed of processing employee requests.
- To maintain proper information about laptop requests.
- To make the procurement process simple and easy to manage.
- To provide a reliable workflow using Flow Designer.

Technologies and Tools Used

Flow Designer

Flow Designer is the main tool used in this project. It is used to create and automate the laptop procurement workflow.

It allows the developer to define:

- Triggers
- Actions
- Conditions
- Approvals
- Flow logic

- Automated activities

The flow starts when a suitable laptop request is created and then performs the required actions automatically.

ServiceNow Platform

The project can be implemented using the ServiceNow platform. ServiceNow provides the environment required to create records, configure workflows, manage requests, and execute Flow Designer flows.

Development Process

The development process is completed in a series of steps.

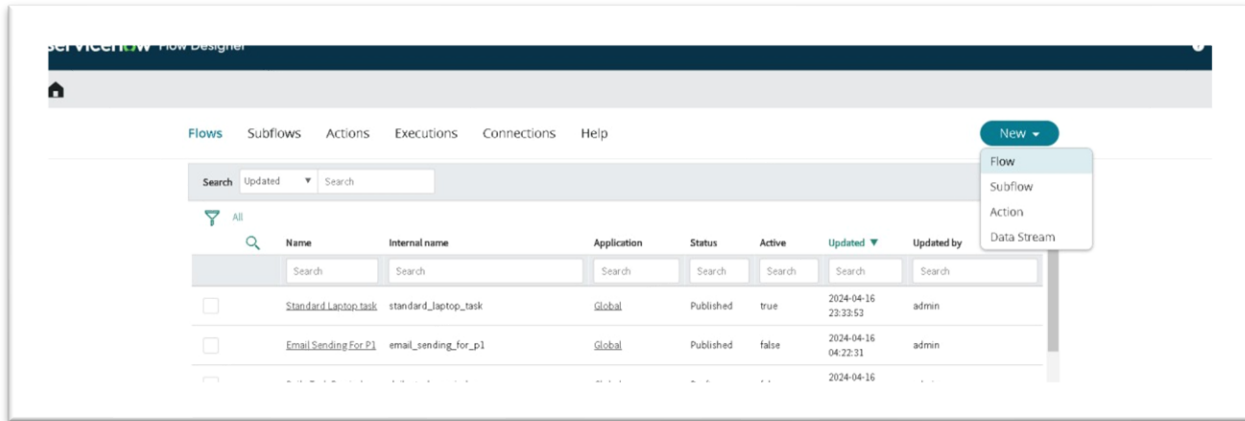

Step 1: Understanding the Requirement Step 2: Creating the Required Data

Field	Description
Requester	Name of the employee requesting the laptop
Employee ID	Identification number of the employee
Laptop Type	Type of laptop requested
Laptop Model	Standard laptop model
Quantity	Number of laptops required
Request Date	Date on which the request is submitted
Approval Status	Current approval status
Request Status	Current status of the request

Creating the Flow

The main development activity is creating the flow in Flow Designer.

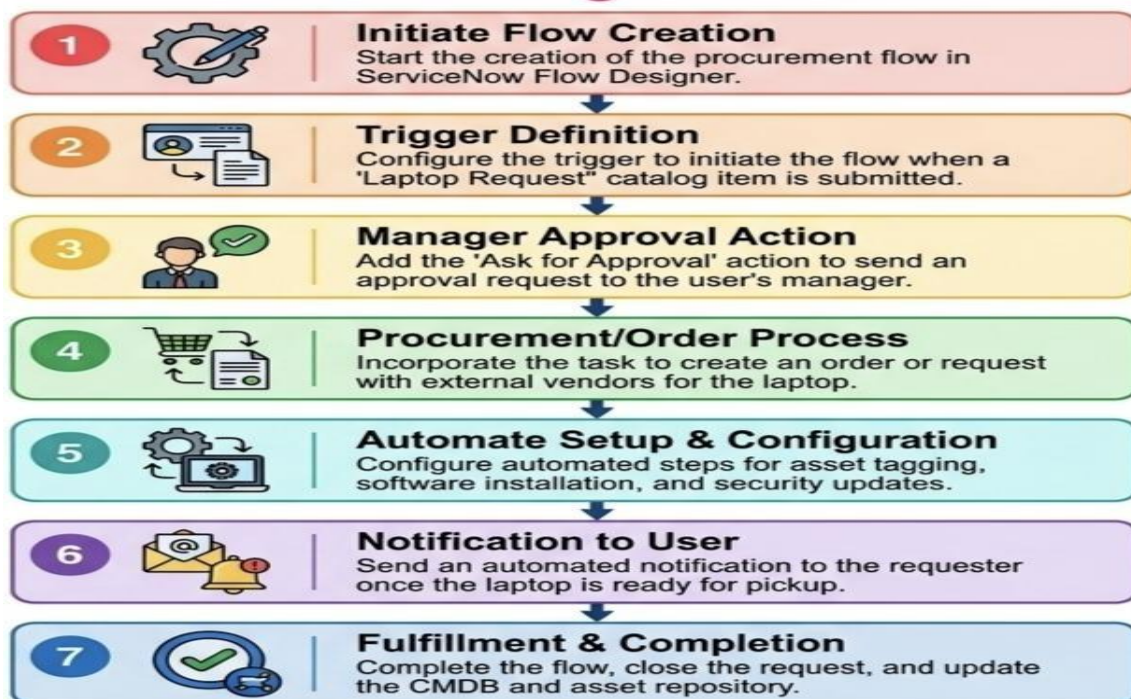

A flow consists of a trigger, followed by different actions and conditions.

The overall process is:

Laptop Request Created → Check Request Details → Validate Standard Laptop → Request Approval → Process Order → Update Status → Complete Request

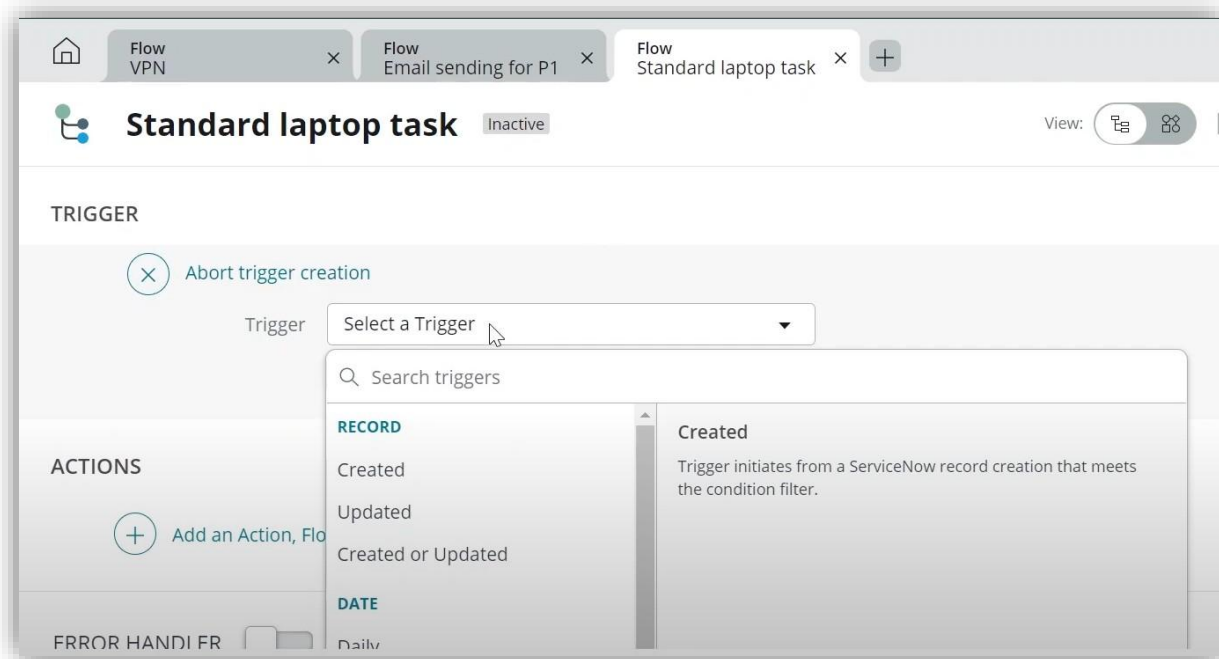

5.5 Creating the Flow

Configuring the Trigger

A new laptop procurement request is created.

When the system detects a new request, Flow Designer automatically starts the workflow.

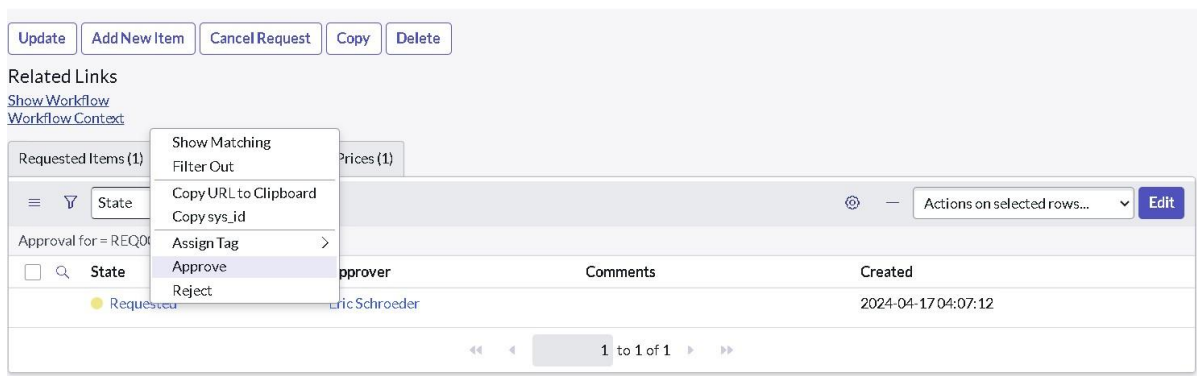

Adding Conditions

If the laptop is a standard model, the request can continue through the automated procurement process. If the request does not satisfy the required conditions, the flow can stop the automated process or send the request for additional review.

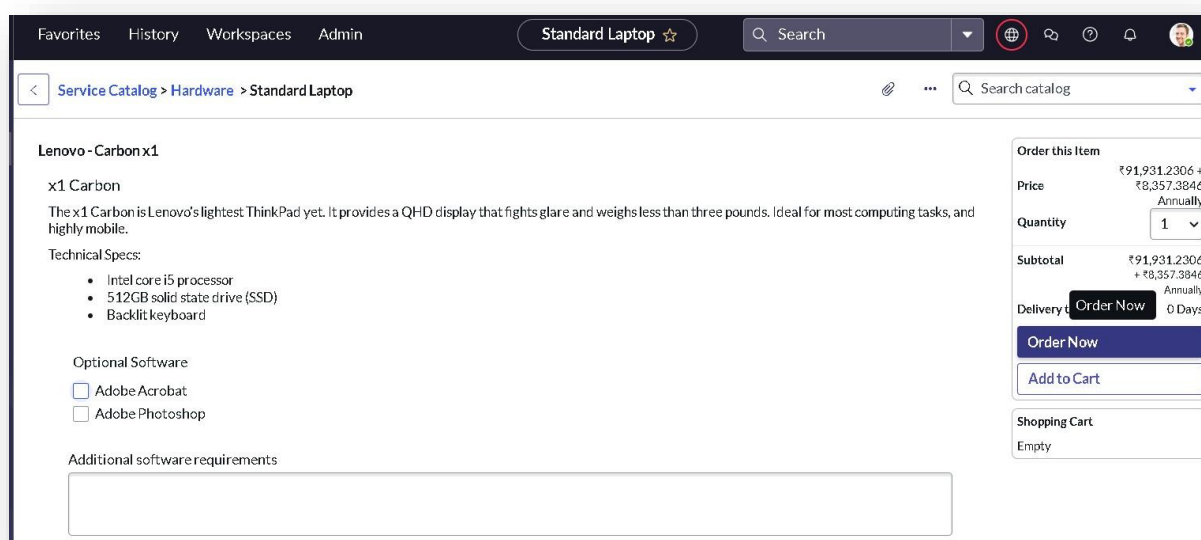

Approval Process

Approval is an important part of the laptop procurement process. After the request passes the required conditions, the system can send the request for approval to the appropriate person or department.

Automating the Laptop Order

After approval, the flow performs the required actions automatically.

Notifications

Similarly, when the request is approved, the requester can be informed that the laptop order has moved to the next stage. A notification can also be sent when the request is rejected.

Order Status

Error Handling

Error handling is another important part of development. The flow should be designed to handle situations where required information is missing or the request does not satisfy the required conditions.

Benefits of the Developed System

- Reduced Manual Work
- Faster Processing
- Reduced Errors
- Better Tracking
- Improved Communication
- Consistent Process
- Easy Management

Development Outcome

At the end of the development phase, the project provides an automated workflow for handling standard laptop procurement requests. The system starts the process when a request is created, checks the request information, handles the approval process, and performs the required actions after approval.

Conclusion

The Project Development Phase converts the requirements and design of **“Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer”** into a working automated process.
