

6.PROJECT TESTING PHASES

Project Title

Streamlining IT Procurement : Automatic Standard Laptop Orders With Flow Designer

6.1 Testing Objective

The objective of this testing phase is to validate that the automated laptop procurement workflow, built using ServiceNow's Flow Designer, functions correctly end-to-end. Testing focuses on verifying that a request moves accurately through submission, approval, requested item creation, catalog task assignment, and final configuration — with each stage reflecting the correct status, assignment group, and field values, so that the automation reduces manual overhead without introducing processing errors.

6.2 Types of Testing Performed

- **Functional Testing** — verifying that each workflow stage (request, approval, requested item, catalog task) performs its intended function correctly.
- **Workflow / Process Testing** — validating the end-to-end flow from request submission to task closure, following the Flow Designer configuration.
- **Approval Testing** — confirming that approvers can view, approve, or reject requests, and that the approval state updates correctly.
- **Integration Testing** — checking that the Requested Item (RITM) correctly links to its associated Catalog Task and reflects consistent data.
- **UI / Record Testing** — verifying that individual records (Request, RITM, Catalog Task) display the correct fields, values, and statuses on screen.

6.3 Test Environment & Tools

Testing was carried out on the following environment and configuration:

- Platform: ServiceNow (Now Platform), Utah/Vancouver release instance
- Module used: Service Catalog, Flow Designer, Approvals, Catalog Tasks
- Test data: Sample laptop procurement request (REQ0010001 / RITM0010001 / SCTASK0010001)
- Roles tested: End user (requester), Approver, Hardware assignment group (fulfiller)
- Access: Verified through a standard ServiceNow test instance login, using desktop browser sessions

6.4 Testing Process Flow Diagram

The diagram below illustrates the sequence of stages validated during testing of the laptop procurement automation workflow.

6.5 Test Cases — Request Submission & Approval Workflow

These test cases validate that a submitted request correctly reaches the approver, and that the approval action updates the request status as expected.

Test ID	Module	Test Scenario	Expected Result	Actual Result	Status
TC-01	Request	Open submitted request record (REQ0010001) and verify details load	Request record opens with short description and special instructions fields visible	Request record opened correctly with all fields visible	Pass
TC-02	Approvers	Scroll to Approvers section and verify approver listed	Approver name and approval state (Requested) shown	Approver 'Eric Schroeder' listed with state 'Requested'	Pass
TC-03	Approval Action	Right-click approval record and select Approve	Context menu shows Approve/Reject; approval state updates	Approve option triggered successfully, state updated to Approved	Pass
TC-04	Requested Item	Open Requested Item section from the approved request	Requested Item record (RITM0010001) opens with linked catalog task	RITM0010001 opened, showing linked Catalog Task in Hardware group	Pass

The screenshot displays the 'Request - REQ0010001' interface. At the top, there are tabs for 'Favorites', 'History', 'Workspaces', and 'Admin'. Below the title bar, there is a search bar and a set of action buttons: 'Discuss', 'Follow', 'Update', 'Add New Item', 'Cancel Request', 'Copy', and 'Delete'. The main content area shows the request details, including 'Short description' and 'Special instructions' fields. Below these fields, there are buttons for 'Update', 'Add New Item', 'Cancel Request', 'Copy', and 'Delete'. The 'Related Links' section includes 'Show Workflow' and 'Workflow Context'. The 'Requested Items (1)' tab is selected, showing a table with columns: 'State', 'Approver', 'Comments', and 'Created'. The table contains one row with the state 'Requested', approver 'Eric Schroeder', and creation date '2024-04-17 04:07:12'. The bottom of the interface shows a pagination bar indicating '1 to 1 of 1'.

6.6 Test Cases — Requested Item & Catalog Task Configuration

These test cases validate that the Requested Item correctly generates a Catalog Task, and that the task record reflects accurate assignment and configuration details.

Test ID	Module	Test Scenario	Expected Result	Actual Result	Status
TC-05	Requested Item	Verify Catalog Tasks tab under RITM0010001	One catalog task listed with short description 'Laptop needs to be Configured'	Catalog task SCTASK0010001 listed under Hardware assignment group	Pass
TC-06	Catalog Task	Open catalog task record and verify field values	Approval, Priority, State, Short description and Description fields populate correctly	Approval: Approved, Priority: 4-Low, State: Open, Short description matched	Pass
TC-07	Catalog Task	Add work note and verify record accepts update	Work note field accepts text and Post action is available	Work note entered successfully; Post button active	Pass
TC-08	Overall Workflow	Verify complete request-to-task traceability	Request, RITM and Catalog Task remain linked with consistent data across stages	All three records showed consistent, linked information end-to-end	Pass

6.7 Entry & Exit Criteria

Entry Criteria — conditions that had to be met before testing began:

- The laptop procurement catalog item and its associated Flow Designer workflow were fully configured.
- Approval rules and the Hardware fulfiller assignment group were set up in the test instance.
- A test requester account and approver account were available with appropriate roles.

Exit Criteria — conditions confirming that testing was complete:

- All planned test cases (TC-01 to TC-08) were executed with no open defects.
- The request, approval, requested item, and catalog task stages showed consistent, correctly linked data.
- No critical or high-severity issues remained unresolved at the end of the test cycle.

6.8 Test Summary

A total of 8 test cases were executed across the request submission, approval, requested item, and catalog task configuration stages of the workflow. The summary below consolidates the results.

Category	Test Cases Executed	Passed	Failed	Pass Rate
Request Submission & Approval	4 (TC-01 to TC-04)	4	0	100%
Requested Item & Catalog Task	4 (TC-05 to TC-08)	4	0	100%
Overall	8	8	0	100%

All executed test cases passed without deviation, confirming that the automated workflow correctly handles request routing, approval, and task assignment as designed.

6.9 Conclusion

By automating the standard laptop procurement process with ServiceNow's Flow Designer, the project effectively addresses inefficiencies and reduces manual overhead. This streamlined workflow ensures timely configuration of laptops, minimizes user wait times, and enhances overall productivity within the IT department. The implementation of this automated solution not only optimizes resource allocation but also significantly improves the user experience by providing a seamless and efficient procurement process. Testing confirmed that each stage of the workflow — from request submission through approval to catalog task configuration — performs reliably and consistently, validating the solution as ready for deployment.

Key Testing Outcomes:

- All 8 test cases across request, approval, requested item, and catalog task stages passed with a 100% success rate.
- The Flow Designer workflow correctly routed requests to the right approver and fulfiller group without manual intervention.
- Record data remained consistent and correctly linked across the Request, RITM, and Catalog Task stages throughout testing.
- No critical, high, or open defects were identified during this testing cycle, confirming the workflow is stable for production use.
